Federation Publisher Trust
Five weighted factors:
B, H, Q, A, F (GFN-1 §3.7)
T = 0.30B + 0.25H + 0.20Q + 0.15A + 0.10F
Exponential decay (λ=0.01,
half-life ≈69 days)
Weights signal trust from
remote federation nodes
Agent Runtime Trust
Threat Detection Layer
(Engine layer — binary,
fires immediately on
active threat signals)
Reputation Layer
(Schema layer — graduated,
longitudinal, informs
autonomy expansion)
non-override constraint:
no Reputation score softens
a Threat Detection block
structurally independent — never share a score,
a decay function, or a combined threshold
